

## Bed Bug Dog Detect

Bed bugs can be a fast-growing problem for businesses such as hotels, hostels and guesthouses. Notorious for impacting brand image, they are difficult to prevent as they can be brought in by unsuspecting guests in luggage and clothing.

A bed bug infestation can result in a variety of negative issues, including:

**Loss of income** - due to room downtime and loss of dining heads

**Health risks** - to hotel residents and staff

**Anxiety and distress** - associated with insect bites

**Customer complaints** - leading to loss of revenue and reputation

### Unique and Effective Bed Bug Monitoring

Rentokil's **Bed Bug Dog Detect** provides unique and highly effective monitoring to businesses with a potential bed bug infestation.

Using a backpack vacuum, trained Rentokil technicians collect a sample of air from the door of a hotel room. This provides **minimum disruption to businesses**, as technicians don't need to fully enter a room to collect a sample.

Once collected, Rentokil send the sample to specially trained dogs, who are able to detect any bed bug activity in the room. This solution provides early detection, as the dogs are **four times more effective** at detecting early bed bug activity compared to human inspections, which allows businesses to treat the infestation before it develops further.

#### Benefits to customers:

Early warning of activity

Reduced disruptions to clientele - saving you time and money dealing with costly infestations, while enhancing your business reputation

Four times more effective
