

Bin Bung

Commercial bins are primary food sources and harborage points for rats.

They often feature drainage holes at the bottom that are frequently left open or have missing plugs, creating an open gateway for pests.

If left untreated, this can lead to a variety of problems:

High pest activity, leading to poor site hygiene

Increased risk of disease transmission

Alternative food sources compete directly with rodenticides

Damage to your business reputation

The Bin Bung is a durable, heavy-duty stopper designed to seal the drainage hole at the bottom of commercial bins

It acts as a physical barrier that completely blocks rats from squeezing into the bin from underneath

Forces rats to consume bait by blocking their access to bin food sources

Heavy-duty, gnaw-resistant construction provides long-lasting defense against recurring pest access

Lowers contamination risk by cutting down rat presence and interactions around bin areas

Upgrades pest management from reactive baiting to a proactive, comprehensive restriction strategy
