External Ant Bait Stations

Safe & effective external ant control

The Ant Bait Station is placed outdoors by simply securing it into the ground. The bait stations are baited and are then positioned wherever foraging ants are causing a problem - around homes and commercial properties

Ants will travel in a wide range searching for food, following trails they have established and clustering around the source of food, becoming a nuisance in homes, organisations and businesses. The Ant Bait Station uses this roaming instinct of the ants to its advantage, by providing the ants with an insecticide bait, which they eat and then take back to the nest, effectively wiping out the rest of the colony.

Benefits to you and your business

- Safe: The use of a tamper resistant lid means it's safe to use in your garden around children and pets.
- Discreet: The inconspicuous, green bait stations blend in with the surrounding areas.
- Peace of Mind: Effective control of Garden Ants around your property.

How it works

The Ant Bait Station is made of rugged green polypropylene - so it blends with outdoor surroundings. It is highly tamperproof, waterproof, and due to its innovative design the bait will not spill out of the entry points.

The foraging ants enter the Ant Bait Station and take the bait from one of two compartments back to the nest. The ant infestation is controlled by the foraging ants taking the insecticide bait back to the nest, which inevitably wipes out the colony.

The Ant Bait Stations need to be serviced as part of a regular Rentokil maintenance contract to ensure that the bait stations are placed in the correct locations around your property and that the right type and amount of ant bait is used throughout the Garden Ant season.
