

Green Bed Bug Solution

Bed bugs can be a fast-growing problem for businesses such as hotels, hostels and guesthouses. Notorious for impacting brand image, they are difficult to prevent as they can be brought in by unsuspecting guests in luggage and clothing.

A bed bug infestation can result in a variety of negative issues, including:

Loss of income - due to room downtime and loss of dining heads

Health risks - to hotel residents and staff

Anxiety and distress - associated with insect bites

Customer complaints - leading to loss of revenue and reputation

Sustainable and Effective Bed Bug Monitoring

Rentokil's **Green Bed Bug Solution** provides a sustainable and safe bed bug eradication programme, with zero toxicity.

The solution utilises a steam treatment at 180°C to cause thermal shock to bed bugs at all life stages, helping to eradicate them from the premises. This can be used on any surface or fabric and can be directed into most hidden cracks and crevices where bed bugs may be harbouring.

In addition to superheated steam, we use a range of non toxic insecticides which work by controlling bed bugs using physical, rather than chemical modes of action.

The treatment is best used for light to medium infestations and is completed safely and effectively by trained Rentokil technicians.

Benefits to customers:

Minimal Disruption

Quick turnaround ensures rooms can be used straight after treatment.

Protects Business Reputation

Pest problems are eradicated promptly, ensuring infestations are quickly contained and managed.

Cost Effective

Effective control with no risk of damage to materials.

Sustainable Solutions

Non-toxic approach, which reduces the use of pesticides.
