

Internal Rodent Monitoring

Rodents can pose a substantial risk to your business and the longer they remain undetected the higher the risk becomes. It is therefore imperative that rodents are detected and controlled quickly to reduce the negative impact on your business.

A rodent infestation in your premises can result in:

Damage to stock and to the infrastructure of the building

Contamination of food and non-food products, via their droppings

Risk of fires from chewed electrical cables

The spread of diseases and parasites

Internal Dual AutoGate

Rentokil's Internal Dual AutoGate is an innovative and flexible solution that monitors and controls rodents in internal areas. The system operates a 'smart' gate mechanism, which secures the rodenticide within the unit and reduces the risk to non-target species. The unit will only be activated and expose the rodenticide when a rodent has been detected.

The Future of Internal Rodent Monitoring

- **Effective control of rodents**
 - allows strategic, internal baiting using rodenticide
- **Targeted baiting programme**
 - with reduced impact to the environment
- **Drives decision making**
 - provides information on internal rodent activity levels
- **Safer and sustainable pest control**
 - allows the use of rodenticide in high risk areas, while reducing the risk to non-target species
